## BÖHLER UDDEHOLM

MATERIALIZING VISIONS

Bohler-Uddeholm M7 HIGH SPEED TOOL STEEL

## General

High alloyed, molybdenum high speed steel with good wear resistance and high toughness. This grade has been manufactured to our internal specifications, and audited to meet our guidelines.

| Typical | C | Si | Mn | Cr | Mo | V | W |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :--- |
| analysis \% | 1.02 | 0.4 | 0.3 | 3.8 | 8.6 | 1.9 | 1.8 |
| Standard | AISI M7, DIN/EN 1.3348 |  |  |  |  |  |  |
| specification | Gold/White/Yellow |  |  |  |  |  |  |
| Color code |  |  |  |  |  |  |  |

## Applications

Taps, twist drills, reamers, milling tools, broaches, cold extrusion dies.

Hot Forming
FORGING
$1650-2010^{\circ} \mathrm{F}\left(900-1100^{\circ} \mathrm{C}\right)$, afterwards, slow cooling in furnace or blanketed with thermo-insulating material.

## Heat treatment

## ANNEALING

1420 to $1545^{\circ} \mathrm{F}\left(770\right.$ to $840^{\circ} \mathrm{C}$ ), controlled slow cooling in furnace at 20 to $35^{\circ} \mathrm{F} / \mathrm{hr}$ ( 10 to $20^{\circ} \mathrm{C} / \mathrm{hr}$ ) to approximately $1110^{\circ} \mathrm{F}\left(600^{\circ} \mathrm{C}\right)$, followed by cooling in still air. Hardness after annealing 280 Brinell, maximum.

## STRESS RELIEVING

To relieve stresses created by extensive machining or tooling with complex geometries. Heat in a neutral atmosphere for 1 to 2 hours after reaching a temperature of 1110 to $1200^{\circ} \mathrm{F}$ ( 600 to $650^{\circ} \mathrm{C}$ ), followed by slow cooling in the furnace.

## HARDENING

Hardening temperature of 2000 to $2210^{\circ} \mathrm{F}\left(1170\right.$ to $1210^{\circ} \mathrm{C}$ ); quench in: oil, salt bath at 930 to $1020^{\circ} \mathrm{F}\left(500\right.$ to $550^{\circ} \mathrm{C}$ ), or vacuum. The upper temperature range should be used for parts of simple geometry, the lower range for more complex tooling. For cold work tooling, lower temperatures are of importance for improved toughness.

Preheat in multiple steps and equalize surface and core temperatures; for example: Step $1-1020^{\circ} \mathrm{F}\left(550^{\circ} \mathrm{C}\right)$, Step $2-1560^{\circ} \mathrm{F}\left(850^{\circ} \mathrm{C}\right)$, and Step $3-1920^{\circ} \mathrm{F}\left(1050^{\circ} \mathrm{C}\right)$ then to the appropriate hardening temperature. The third preheat is only required for complex geometries.

## RECOMMENDED HOLDING TIME, FLUIDIZED BED, VACUUM OR ATMOSPHERE FURNACE

Note: Holding time = time at austenitizing temperature after the tool is fully heated through.

TOTAL SOAKING TIME IN A SALT BATH AFTER PRE-HEATING IN TWO STAGES AT $450^{\circ} \mathrm{C}\left(840^{\circ} \mathrm{F}\right)$ AND $850^{\circ} \mathrm{C}\left(1560^{\circ} \mathrm{F}\right)$

## Tempering

Slowly and uniformly heat to the appropriate tempering temperature immediately after the hardening operation. Once the temperature of the tool has been equalized, a soaking period of one hour per inch ( 25 mm ) of workpiece thickness is required, but not less than 2 hours. First and second tempers should be used to reach the desired hardness level, and the third selected for additional stress relief at $85-120^{\circ} \mathrm{F}(30$ to $50^{\circ} \mathrm{C}$ ) below the highest tempering temperature. Intermittent cooling, in air, between tempers is required for a minimum of 1 hour. Obtainable hardness of 64 to 66 HRC .

## TEMPERING CHART

Hardening temperature: $2175^{\circ} \mathrm{F}\left(1190^{\circ} \mathrm{C}\right)$ Specimen size: square cross section 20 mm

## Surface treatment

## NITRIDING

Parts made from this steel may be nitrided via the plasma, gas or salt bath processes

## Electrical-discharge machining-EDM

If EDM is performed in the hardened and tempered condition, the tool should then be given stress temper at a temperature that is at least $50^{\circ} \mathrm{F}\left(25^{\circ} \mathrm{C}\right)$ below the lowest tempering temperature.
